AI Education: Learning in the Age of Agents

Timothy Gowers

CONTENTS

GOSIM Paris 2026

Part 01

A dream outcome

Part 02

How good are LLMs at teaching mathematics?

Part 03

Will the dream become a reality?

01

AI and mathematics teaching

- AI becomes at least as good at teaching mathematics as most human mathematics teachers.
- The worldwide shortage of mathematics teachers is much less of a problem.
- Excellent mathematics teaching is available not just to the privileged few.
- Mathematics teaching is tailored to the individual student and optimized for efficiency.

Positive points.

- They are very good at giving standard textbook-style explanations.
- They are capable of diagnosing simple errors.

Negative points.

- They are too keen to give detailed answers.
- They do not seem to be aware that even a perfectly coherent explanation may be very confusing to some people.
- If one style of explanation doesn't work, they typically stick with it and don't jump to another one.

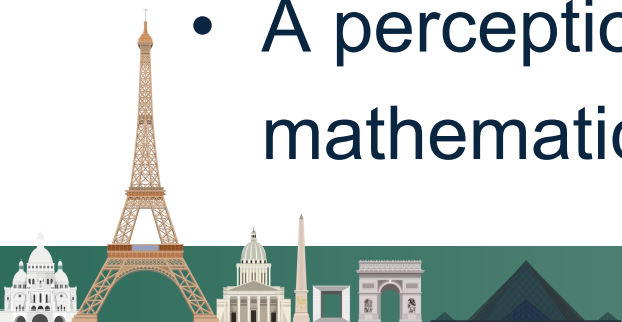

What we would need.

- AI agents that have a better understanding of how humans think, particularly when they are still learning.
- Shorter units of dialogue, proper integration of voice with mathematical text, more “human” interaction, maybe gamification.

Possible problems.

- Less motivation when learning mathematics from machines.
- A perception that humans no longer need to understand mathematics.

Thanks!
