Can you share a prompt that solves G? I couldn't do it with GPT.

[here with GPT 5 Pro](#)

I retyped the definition which includes exponentiation, but the remaining parts are copy-pasted.

以下の問題を解くプログラムを C++ にて作成してください。

For a positive integer a , we define a recurrence $\{b_r\}$

We say that a positive integer a

is m

-tetrative if the sequence b

stabilizes to 1

modulo m

, that is, there exists $N \geq 0$

such that $b_n \equiv 1 \pmod{m}$

for all $n \geq N$

.

For a given m

, calculate the density of the m

-tetrative integers. Here, the density of a set S

is the limit

$\lim_{n \rightarrow \infty} |S \cap [1, 2, \dots, n]| / n$.

Informally, it is the "proportion" of positive integers

-tetrative.

🗣️ 语音

を計算（逆元はフェルマで）。

すべての分解は 10^6 までの最小素因数表（SPF）で高速に行えます。

計算量はテストケースあたり実質「 x, y, z と $p - 1$ 達の分解」だけなのでとても軽いです。

3. 実装 (C++17, long long 使用)

cpp

复制代码

```
#include <bits/stdc++.h>
using namespace std;

using int64 = long long;
const int MAXA = 1000000;
const int64 MOD = 998244353;

// ----- SPF（最小素因数）を線形ふるいで作る -----
vector<int> spf(MAXA + 1);
vector<int> primes_list;
```
