

How Can Europe Collaborate Globally While Maintaining Technological Sovereignty? – The Agentic AI Case

Dr Hai-Xu Cheng
CTO, Rothwell International

As CTO of Rothwell International, Hai-Xu's current major focus is providing consulting services for enterprise clients at C-level on ARCHITECTURE, STANDARDS and OPEN SOURCE. Hai-Xu recently retired from the role of IBM Global Lead and IBM GCG CTO of standards and open source. While at IBM, Hai-Xu led the IBM global & China teams working to develop open source communities and technologies that span AI, data & analytics, cloud computing, quantum computing, & blockchain etc & advocated the clients adopting the open technologies to fuel innovation in both technical and business domains. Hai-Xu has actively engaged in developer advocacies, open source projects promotion & ecosystem development. Hai-Xu has personally involved in the development of many international standards at ISO/IEC JTC1 SC42 (AI), SC38 (Cloud), & ISO TC307 (Blockchain) & China standards at CCSA (ICT), TC260 (Cybersecurity), TC28 (SC38 (Cloud), SC42(AI)).

Dr Hai-Xu Cheng
CTO, Rothwell
International

Agentic AI Today: Europe's Strengths and Dependencies

EUROPEAN STRENGTHS

- Strong AI research in universities
- Active open source contributors
- GDPR and AI Act leadership
- Eclipse ADL – European agent runtime in production at Deutsche Telekom
- EuroHPC supercomputers
- GAIA-X for sovereign data
- Growing agent research community
- Horizon Europe projects building agent infrastructure

DEPENDENCIES

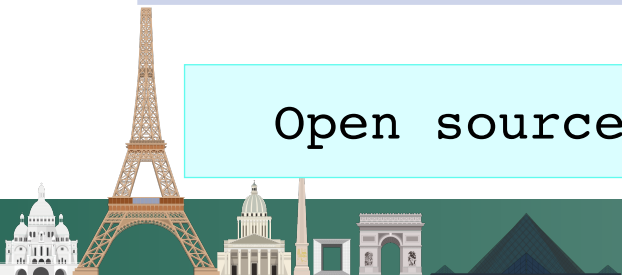

- Most agent frameworks originate outside Europe, the code is open but Europe is not in the core team for governance and stewardship
- Core AI technologies LLMs that power agents are mostly non-European
- Agent hosting and computing dominated by global hyperscalers
- Agent standards emerging but fragmented

Agentic AI is being built now. Europe is mostly a user, not a shaper yet

Challenges	Opportunities	How Open Source can Help
Vendor lock-in.	European agent frameworks.	Open source can be forked, audited, & run anywhere.
Data sovereignty & local data residency.	GAIA-X, EuroHPC, European sovereignty clouds or On-premise	Open source agents can run on GAIA-X. Full data control.
New evaluation tools developing.	Invest in COMPL-AI/EU-Agent-Bench	Open source evaluation tool grows with community
Technical standards emerging.	Europe can lead	Open source is where standards emerge, Eclipse ADL sample.

Open source agentic AI = global collaboration + European control

What to Remember: Agentic AI and European Sovereignty

Agentic AI is
built now, and
evolve fast

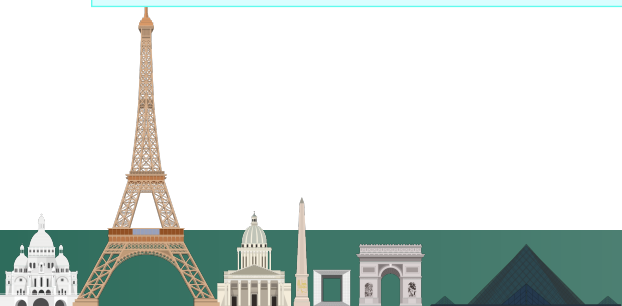

Open source is
the sovereignty
tool for AI agent
be Solved

Europe must
act now to shape
agent technology
& standard

Europe can collaborate on Agentic AI globally AND take control -
by leading and contributing open source agent communities.

Thanks!
