Safety Is the Scaling Layer

Europe in the Age of Agentic AI

Nicolas Mialhe
AI Safety Connect
06.05.2026

Capability has converged.

Llama, Mistral, DeepSeek, Qwen — the gap between open and closed frontier models has largely collapsed. Open-weight releases are now genuine frontier artifacts.

Governance has diverged.

No shared evaluation thresholds.
No agent verification standard.
No release discipline. No cross-jurisdictional accountability for autonomous systems.

In the agentic era, safety is the scaling layer — not the brake.

Three European assets

Talent & industrial depth

World-class ML research; deep sectoral base across health, mobility, energy, finance, public sector.

Regulatory maturity

EU AI Act, codes of practice, EU AI Office, national AISIs — the first serious governance stack.

Credible neutrality

Between US chip & closed-model dominance and China's open-weight lead — a bridge both can live with.

Three things to build

Agent verification infrastructure

Behavioural evaluation, identity & authorisation, audit trails for autonomous systems acting across tools and jurisdictions.

Shared evaluation methodologies

Capability & risk thresholds with cross-jurisdictional evidentiary basis (International Safety Exchange Report; International AI Safety Report).

Open-weight release discipline

Not restriction of openness but conditions that make openness governable as capability scales.

Idea: A European agent verification commons, plugged into the EU Frontier AI Initiative.

International Scientific Panel on AI

International Scientific Exchange on
AI Safety

81st Session of the UN General Assembly

Europe's agentic moment isn't "open vs safe." It's proving they're the same move.

Thanks!
