Topic

Bridging AI Evaluation and Real-World Deployment: Place-Based Evaluation Testbeds for High-Trust Public Domains

Dr. Gábor Soós

Advisory Committee Member, ICCSD UNESCO

Bridging AI Evaluation and Real-World Deployment

Place-Based Evaluation Testbeds for High-Trust Public Domains

Gábor Soós, PhD

**ICCSD Advisory Committee Member (personal
capacity)**

CONTENTS

Part 01

From benchmarks to deployment readiness

Part 02

Place-based evaluation testbeds

Part 03

Tihany as a high-trust reference environment

Part 04

Eclipse, and PanEval, next steps,

Session logic so far:

- Agentic systems require new evaluation
- Open infrastructure enables scalable evaluation
- Governance sets conditions for trust

Missing layer:

- Real-world deployment environments
- High-trust public domains
- Evaluation under public-facing conditions

Benchmarks tell us:

- task performance
- comparative model strength
- progress on defined tasks

Deployment requires more:

- traceability and auditability
- robustness and safe abstention
- documentation readiness
- contextual reliability

**The real question is not only “Can the model answer?”
but “*Can the system be trusted in context?*”**

We need evaluation environments, not only evaluation metrics.

Public-facing AI should be assessed also in environments where

- **institutional context,**
- **user diversity,**
- **ambiguity,**
- **accountability**

are part of the evaluation conditions.

Place-based evaluation testbeds provide that missing layer.

They make it possible to test system behavior under realistic public-facing constraints — not only response quality, but *deployment readiness*.

Controlled retrieval, curated sources, feedback loop

Part of broader place-centric semantic meta-framework,
Chrono-TOLMA: Chrono - Topos – Logos - Materia

Places concentrate:

- institutions
- narratives and users
- materials and infrastructures
- contested meanings

Ideal for testing:

- hallucination and abstention
- provenance and traceability
- contextual robustness
- public-facing reliability

Taken together, these form complex relational environments.

A reference environment for deployment-facing evaluation

Why Tihany:

- cultural landscape
- multiple institutions and communities
- multilingual public-facing use case
- culture, education, and environment together

Why it matters:

- evaluation-ready deployment pattern
- bridge to Source2Sea: Bartók 4.0 Connectivity
- public-interest AI beyond tourism

PanEval and Eclipse can benefit from

- high-trust real-world use cases,
- deployment-facing evaluation scenarios, and
- place-based testbeds linking infrastructure, evaluation, governance, and deployment sites

Next step for open evaluation is not only better benchmarks, but **real-world testbeds** where

- technical capability and
- *societal trust*

can be assessed together.

If data is the oil of the 21st century, then TRUST is the basis of INFRASTRUCTURE in which it can function at all.

Thanks!
